Table 1: Revision History

1 Introduction

1.1 Objective

The purpose of this report is to specify the methodology of testing to be used for Pylinkvalidator in detail. Every test case will be accompanied by a short description to convey the reason each test was written as well as a breakdown of expected results as well as whether those results were achieved or not. Following that section the document will trace the tests back to the requirements and then provide a more general summary of the results of testing.

1.2 Approach

The methodology to be used for testing will involve a succinct set of tests to prove each requirement is fully functional and performing at an acceptable level. These tests will cover white-boxed boundary cases, cases dealing with extremes as well as standard cases.

Certain tests, such as those concerning usability or involving acquiring user input, are tested much more straightforwardly using manual methods. Therefore, these sorts of tests will be performed in a manual manner. All other tests will be conducted using automated testing utilizing a testing suite known as PyUnit.

Term	Meaning
html	Hypertext Markup Language

Table 2: Acronyms & Abbreviations

Term	Definition					
PyUnit	A widely accepted testing suite to be used with the					
	Python programming language.					
$\{\emptyset\}$	Denotes an empty set, not to be confused with {0} which					
	is a set containing only 0.					
Beautiful Soup	tiful Soup An existing framework that breaks a webpage down int					
	its components.					

Table 3: Definitions

1.3 Tables of Acronyms, Abbreviations & Definitions

2 Functional System Tests

2.1 F1: Exact String Searching

Process:

- 1. Receive String to be parsed through and a query to search for.
- 2. Search through that String for the query.
- 3. Check that the results of the search match those that should be returned.

The queries used for each input String will be as follows:

- hello
- \bullet LASDGLKGSVLIUGAEOUGSVLUHwe;
ofrw.k?bwri;hqf.IBA LIU GqleiugwKUGwrliugwrgOUGFW;OURW;U
- Eric
- my name is Eric!
- my name is Eric

The input Strings used will be as follows:

- 1. "Hello world!"
- 2. ""
- 3. "Hello. My name is Eric. I am writing this simple test to check to see how well my parsing algorithm is performing. hello again, don't forget my name: Eric. That is all."

Input	Expected Result	Actual Result
	(0)	(0)
1	$\{0\}$	$\{0\}$
	$\{\emptyset\}$	$\{\emptyset\}$
2	$\{\emptyset\}$	$\{\emptyset\}$
	$\{\emptyset\}$	$\{\emptyset\}$
3	{0, 114}	{0, 114}
	$\{\emptyset\}$	$\{\emptyset\}$
	$\{18, 149\}$	$\{18, 149\}$
	$\{\emptyset\}$	$\{\emptyset\}$
	$\{7\}$	{7}

Table 4: F1 Tests

2.2 F2: Similar String Searching

The tests that were run during F1 will be ran again in the same fashion using a proximity of 0. This forces the same functionality as performing an exact String search and so the results shall be the same as above.

Process:

- 1. Receive String to be parsed through and a query to search for.
- 2. Search through that String for the query.
- 3. Check that the results of the search match those that should be returned.

H Input	Expected Result	Actual Result
String: "Here comes my hero"		
Query: "HERE"		
proximity: 1	$\{0, 14\}$	$\{0, 14\}$
String: "Some text, hello"		
Query: "hello"		
proximity: 2	{11}	{11}
String: "hehhhehellp"		
Query: "hello"		
proximity: 1	$\{6\}$	$\{6\}$
String: ". $\n q1/.SQL \n q2.SQL$		
\n fileResult.txt"		
Query: "fileResults"		
proximity: 1	$\{28\}$	$\{28\}$
String: ". \n \n q1/.SQL \n q2.SQL		
\n fileResult.txt"		
Query: "fileResults"		
proximity:	{32}	$\{\emptyset\}$

Table 5: F2 Test Cases

2.3 F3: BFS Execution

This test will be created in an environment to effectively test depth of a BFS. The depth folder is structure in such a way the root.html, link to the 1.html and 1.html links to 2.html and 2,html links to 3.html and so on. With this structure you can test the depth 0 -5

H Input	Expected Results	Actual Results
url: "/depth/root.html"		
depth: "0"	f	F
	[u'root.html']	[u'root.html']
url: "/depth/root.html"		
depth: "1"	[2 / +]-+]2	[, /1,1,
	[u'/root.html', u'/0.html']	[u'/root.html',
url: "/depth/root.html"	u / 0.11011111]	u'/0.html']
depth: "2"		
dopuii. 2	[u'/root.html',	[u'/root.html',
	u'/0.html', u'/1.html']	
url: "/depth/root.html"	, , , ,	, , ,
depth: "3"		
	[u'/root.html',	- ,
		u'/0.html', u'/1.html',
	u'/2.html']	u'/2.html']
url: "/depth/root.html"		
depth: "4"	[w//maat lateral?	[' /mo of lateral'
	[u'/root.html',	[u'/root.html', u'/0.html', u'/1.html',
	u'/2.html', u'/3.html']	
url: "/depth/root.html"	u / 2.1101111 , u / 3.1101111]	<u>u / 2.1101111 , u / 3.1101111]</u>
depth: "5"		
5	[u'/root.html',	[u'/root.html',
	£ ,	u'/0.html', u'/1.html',
	u'/2.html', u'/3.html',	
	u'/4.html']	u'/4.html']

Table 6: F3 Test Cases

2.4 F4: Program Navigation

Process:

This test will be conducted by manually entering each possible value the program prompts for. Once entering a number, the program shall use that option as appropriate. Values that are not within the acceptable set of options shall return a result specifying that the value entered is invalid.

H Input	Expected Results	Actual Results
value: 1		
	Download Resources	Download Resources
value: 2		
	Check for Errors	Check for Errors
value: 3		
	Search for Query	Search for Query
url: "/depth/root.html"		
value: 4		
	Just Crawl	Just Crawl
url: "/depth/root.html"		
value: 100		
	Incorrect input.	Incorrect input.

Table 7: F4: Program Navigation

2.5 F5: Grab Links

Process:

The program is going to take all the links on any page

H Input	Expected I	Results	Actual Res	ults
input HTML: $\langle html \rangle \langle body \rangle$	[None,	u'a.html',	[None,	u'a.html',
< ahref = "#" > Testhash < /a >	u'sub/b.ht	ml',	u'sub/b.htr	nl',
< aname = "hello" > Testname < /a >	> u'/c.html',	u'd.html',	u'/c.html',	u'd.html',
< ahref = "a.html" > TestA < /a >	u'//www.p	erdu.com']	u'//www.p	erdu.com']
< ahref = "sub/b.html" > TestB < /a	<i>x</i> >			
< ahref = "/c.html" > TestC < /a >				
< ahref = "d.html" > TestD < /a >				
< ahref = "//www.perdu.com" > Test	tExternal <	/a >		

Table 8: F5 Test Cases

2.6 F6: HTML Correction

Process:

The program is going to correct any url that is missing a HTTP SCHEME such as HTTP,www or the base url. So is a url is just /about, it program will append /about with the base url. And is a url is missing a www, or HTTP:// ,this should fix that issue..

writh writ	H Input	Results	Status

Table 9: F6 Test Cases

2.7 F7: Error Notifications

Process:

This test will be conducted to check errors and success on my test html pages. 404 error means the page doesn't exist and 200 means it exist and it is healthy and has no errors.

Results	Status
Error code: 404	PASS
Status code: 200	PASS
	Error code: 404

Table 10: F7 Test Cases

3 Non-Functional Tests

3.1 Usability

U1: A user that knows how to execute a Python application should be able to operate this program without difficulty.

3.2 Performance

P1: All String searching operations shall be completed within a second assuming the input String isn't unreasonably large.

P2: Grabbing links from a page using Beautiful Soup shall be completed within a second assuming the webpage isn't unreasonably large.

3.3 Robustness

Implicitly included within the list of functional test cases since extreme cases as well as boundary cases will be performed.

4 Traceability to Requirements

Requirement	Associated Requirement
Designation	
F1	Functional requirements 5 and 7.
F2	Functional requirements 5 and 7.
F3	Functional requirements 3 and 5
F4	Functional requirements 1, 2, 3, 4 and 7
F5	Functional requirements 5
F6	Functional requirements 1, 4, 5
F7	Functional requirements 1
U1	Non-Functional requirements:
P1	Non-Functional requirement: Performance
P2	Non-Functional requirement: Performance

Table 11: Traceability to Requirements

5 Testing Summary

5.1 Usability Testing

For our Usability testing we had a few participants execute common actions within the system. We found that while the log-in process was received quite well by all the participants, there was sort of an issue with the command-line interface. For the downloading of the Webcrawler program files, it wasn't hard for the participants. Although they felt the number of files needed to be downloaded for the program was a bit too much and the initialization of the command line was a bit tedious. Inputting the option for the web crawler program wasn't deemed as hard by most users.

5.2 Performance Testing

We will want to test the number of active users that can be on the system at one time even though each user of the program is independent of the other. We will also want to test the number of active users that can be downloading resources at the same time from the same website. These tests will also be run using the same website on multiple browsers to test compatibility. To test the performance of a single user, we manually executed tasks that the user normally would.

5.3 Security

Security concerns have already been validated. Every user of the program has a different command line interface, no additional security is required. In light of this, we focused on getting feedback in other areas.

5.4 Response to feedback

At the moment we are considering creating a user manual to make using this program on the command line much easier. One participant expressed during a task where they were to check for errors difficult, we assume that the right installation was not made in the users command line. The solution to this will be in the user manual. Participants were generally pleased with the way the program worked.

5.5 Changes Due to Testing

The interface for saving html links needs some refinement, There were some changes implemented; however, more refinement will occur during future implementations

6 Code Coverage

Requirement	Positive TC Result	Negative TC Result
Locate Information and re-	Pass	Pass
lated websites		
Automatically download re-	Pass	Pass
sources from a web page.		
View list of status codes	Pass	Pass
from website		
Specify website to crawl	Pass	Pass
Audit Content on compa-	Pass	Pass
nies website		
Map website Depth	Pass	Pass
Return website status code	Pass	Pass

Table 12: Code Coverage

We have successfully run our tests. From the tests we conducted, we feel that we have achieved a proficient coverage rate. We see that a few of our methods have never been called and this methods in our opinion do not need to be tested. We are content with our code coverage since we realize that the amount of testing necessary depends on a number of factors, and since this is our code we are aware of the factors.
